Book Description

Title: Internal Combustion Engine

Author: M. l. Mathur and R. P. Sharma

Publisher: Dhanpat Rai Publications, New Delhi

Edition: 8

Year: 2010

ISBN: 9788189928469

Scilab numbering policy used in this document and the relation to the above book.

Exa Example (Solved example)

Eqn Equation (Particular equation of the above book)

AP Appendix to Example(Scilab Code that is an Appednix to a particular Example of the above book)

For example, Exa 3.51 means solved example 3.51 of this book. Sec 2.3 means a scilab code whose theory is explained in Section 2.3 of the book.

Contents

List of Scilab Codes

Chapter 1

Introduction

Scilab code Exa 1.1 Calculation of cubic capacity and clearance volume

```
//Calculation of cubic capacity and clearance volume
clc,clear
//Given:
n=4 //Number of cylinders
d=68/10 //Bore in cm
l=75/10 //Stroke in cm
r=8 //Compression ratio
//Solution:
V_s=(%pi/4)*d^2*l //Swept volume of one cylinder in
   cm^3
cubic_capacity=n*V_s //Cubic capacity in cm^3
//Since, r = (V_c + V_s)/V_c
V_c=V_s/(r-1) //Clearance volume in cm^3
//Results:
printf("\n The cubic capacity of the engine = %.1f
   cm^3",cubic_capacity)
printf("\n The clearance volume of a cylinder, V_c =
    %.1f cm^3\n\n",V_c)
```

Scilab code Exa 1.2 Calculation of brake power and friction power

```
//Calculation of brake power and friction power
clc,clear
//Given:
ip=10 //Indicated power in kW
eta_m=80 //Mechanical efficiency in percent
//Solution:
//Since, eta_m = bp/ip
bp=(eta_m/100)*ip //Brake power in kW
fp=ip-bp //Friction power in kW
//Results:
printf("\n The brake power delivered, bp = %d kW\n",
   bp)
printf(" The friction power, fp = %d kW\n\n",fp)
```

Scilab code Exa 1.3 Calculation of mechanical efficiency

```
//Calculation of mechanical efficiency
clc,clear
//Given:
bp=100 //Brake power at full load in kW
fp=25 //Frictional power in kW (printing error)
//Solution:
eta_m=bp/(bp+fp) //Mechanical efficiency at full
   load
//(a)At half load
bp=bp/2 //Brake power at half load in kW
eta_m1=bp/(bp+fp) //Mechanical efficiency at half
   load
//(b)At quarter load
bp=bp/2 //Brake power at quarter load in kW
eta_m2=bp/(bp+fp) //Mechanical efficiency at quarter
    load
//Results:
```

```
printf("\n The mechanical efficiency at full load, eta_m = %d percent",eta_m*100)
printf("\n The mechanical efficiency,\n (a)At half load, eta_m = %.1f percent\n (b)At quarter load, eta_m = %d percent\n\n",eta_m1*100,eta_m2*100)
//Data in the book is printed wrong
```

Scilab code Exa 1.4 Calculations on four stroke petrol engine

```
//Calculations on four stroke petrol engine
clc,clear
//Given:
bp=35 //Brake power in kW
eta_m=80 //Mechanical efficiency in percent
bsfc=0.4 //Brake specific fuel consumption in kg/kWh
A_F=14/1 //Air-fuel ratio
CV=43000 //Calorific value in kJ/kg
//Solution:
//(a)
ip=bp*100/eta_m //Indicated power in kW
//(b)
fp=ip-bp //Frictional power in kW
//(c)
//Since, 1 kWh = 3600 kJ
eta_bt=1/(bsfc*CV/3600) //Brake thermal efficiency
//(d)
eta_it=eta_bt/eta_m*100 //Indicated thermal efficiency
//(e)
m_f=bsfc*bp //Fuel consumption in kg/hr
//(f)
m_a=A_F*m_f //Air consumption in kg/hr
//Results:
printf("\n (a)The indicated power, ip = %.2f kW\n (b)The friction power, fp = %.2f kW",ip,fp)
```

```
printf("\n (c)The brake thermal efficiency , eta_bt = %.1f percent\n (d)The indicated thermal efficiency , eta_it = %.1f percent",eta_bt*100,eta_it*100)
printf("\n (e)The fuel consumption per hour , m_f = %.1f kg/hr\n (f)The air consumption per hour , m_a = %d kg/hr\n\n",m_f,m_a)
```

Scilab code Exa 1.5 Calculations on SI engine

```
//Calculations on SI engine
clc,clear
//Given:
F_A=0.07/1 //Fuel−air ratio
bp=75 //Brake power in kW
eta_bt=20 //Brake thermal efficiency in percent
rho_a=1.2 //Density of air in kg/m^3
rho_f=4*rho_a //Density of fuel vapour in kg/m^3
CV=43700 //Calorific value of fuel in kJ/kg
//Solution:
m_f=bp*3600/(eta_bt*CV/100) //Fuel consumption in kg/hr
m_a=m_f/F_A //Air consumption in kg/hr
V_a=m_a/rho_a //Volume of air in m^3/hr
V_f=m_f/rho_f //Volume of fuel in m^3/hr
V_mixture=V_f+V_a //Mixture volume in m^3/hr
//Results:
printf("\n The air consumption , m_a = %.1f kg/hr",m_a)
printf("\n The volume of air required , V_a = %.1f m^3/hr",V_a)
printf("\n The volume of mixture required = %.1f m^3/hr\n\n",V_mixture) //(printing error)
//Answer in the book is printed wrong
```

Scilab code Exa 1.6 Calculations on diesel engine

```
//Calculations on diesel engine
clc,clear
//Given:
bp=5 //Brake power in kW
eta_it=30 //Indicated thermal efficiency in percent
eta_m=75 //Mechanical efficiency in percent (printing error)
//Solution:
ip=bp*100/eta_m //Indicated power in kW
CV=42000 //Calorific value of diesel(fuel) in kJ/kg
m_f=ip*3600/(eta_it*CV/100) //Fuel consumption in kg/hr
//Density of diesel(fuel) = 0.87 kg/l
rho_f=0.87 //Density of fuel in kg/l
V_f=m_f/rho_f //Fuel consumption in l/hr
isfc=m_f/ip //Indicated specific fuel consumption in kg/kWh
bsfc=m_f/bp //Brake specific fuel consumption in kg/kWh
//Results:
printf("\n The fuel consumption of engine, m_f in,\n (a)kg/hr = %.3f kg/hr\n (b)litres/hr = %.2f l/hr",m_f,V_f)
printf("\n\n (c)Indicated specific fuel consumption, isfc = %.3f kg/kWh",isfc)
printf("\n (d)Brake specific fuel consumption, bsfc = %.3f kg/kWh\n\n",bsfc)
//Data in the book is printed wrong
```

Scilab code Exa 1.7 Calculations on two stroke CI engine

```
//Calculations on two stroke CI engine
clc,clear
//Given:
bp=5000 //Brake power in kW
fp=1000 //Friction power in kW
m_f=2300 //Fuel consumption in kg/hr
A_F=20/1 //Air-fuel ratio
CV=42000 //Calorific value of fuel in kJ/kg
//Solution:
//(a)
ip=bp+fp //Indicated power in kW
//(b)
eta_m=bp/ip //Mechanical efficiency
//(c)
m_a=A_F*m_f //Air consumption in kg/hr
//(d)
eta_it=ip*3600/(m_f*CV) //Indicated thermal efficiency
//(e)
eta_bt=eta_it*eta_m //Brake thermal efficiency
//Results:
printf("\n (a)The indicated power, ip = %d kW",ip)
printf("\n (b)The mechanical efficiency, eta_m = %d percent",eta_m*100)
printf("\n (c)The air consumption, m_a = %d kg/hr",m_a)
printf("\n (d)The indicated thermal efficiency, eta_it = %.1f percent\n (e)The brake thermal efficiency, eta_bt = %.1f percent\n\n",eta_it*100,eta_bt*100)
```

Chapter 2

Air Standard Cycles

Scilab code Exa 2.1 Calculations on Carnot engine

```
//Calculations on Carnot engine
clc,clear
//Given:
T2=27+273 //Temperature of cooling pond in K
eta=30 //Efficiency in percent
Q2=200 //Heat received by cooling pond in kJ/s
//Solution:
//Since, eta = (Q1-Q2)/Q1 = (T1-T2)/T1
T1=T2/(1-(eta/100)) //Temperature of heat source in
    K
Q1=Q2/(1-(eta/100)) //Heat supplied by source in kJ/
    s
Power=round(Q1-Q2) //Power of engine in kJ/s
//Results:
printf("\n Temperature of heat source, T1 = %.1f
    degreeC",T1-273)
printf("\n Power of engine = %d kW\n\n",Power)
```

Scilab code Exa 2.2 Calculations on the Carnot cycle

```
//Calculations on the Carnot cycle
clc,clear
//Given:
T3=800+273,T1=15+273 //Temperature of a hot and cold
    reservoir in K
P3=210,P1=1 //Maximum and minimum pressure in bar
//Solution:
//Refer fig 2.21
eta_carnot=1-(T1/T3) //Efficiency of Carnot cycle
T4=T3 //Isothermal process 3-4
g=1.4 //Specific heat ratio(gamma)
P4=P1*(T4/T1)^(g/(g-1)) //Initial pressure of
    isentropic process 4-1 in bar
R=0.287 //Specific gas constant in kJ/kgK
Q3_4=R*T3*log(P3/P4) //Heat supplied in kJ/kg
W3_4=Q3_4 //Work supplied in kJ/kg
Net_work=eta_carnot*Q3_4 //Net work output in kJ/kg
cv=0.718 //Specific heat at constant volume in kJ/
    kgK
W4_1=cv*(T4-T1) //Work for isentropic process in kJ/
    kg
Gross_work=W3_4+W4_1 //Gross work supplied in kJ/kg
work_ratio=Net_work/Gross_work //Work ratio
//Results:
printf("\n The efficiency of the Carnot cycle,
    eta_carnot = %.1f percent",eta_carnot*100)
printf("\n The work ratio of the Carnot cycle = %.3f
    \n\n",work_ratio)
```

Scilab code Exa 2.3 Calculation of air standard efficiency of Otto cycle

```
//Calculation of air standard efficiency of Otto
    cycle
clc,clear
//Given:
```

```
d=17,l=30 //Bore and stroke in cm
V_c=0.001025 //Clearance volume in m^3
//Solution:
V_s=(%pi/4)*d^2*l //Swept volume in cc
V_c=V_c*10^6 //Clearance volume in cc
V=V_c+V_s //Total cylinder volume in cc
r=V/V_c //Compression ratio
g=1.4 //Specific heat ratio(gamma)
eta=1-1/r^(g-1) //Air standard efficiency
//Results:
printf("\n The Air standard efficiency of Otto cycle
    , eta = %.1f percent\n\n",eta*100)
```

Scilab code Exa 2.4 Calculations on constant volume cycle

```
//Calculations on constant volume cycle
clc,clear
//Given:
P1=97 //Pressure at the beginning(1) in kN/m^2
T1=40+273 //Temperature at the beginning(1) in K
r=7 //Compression ratio
Q=1200 //Heat supplied in kJ/kg
g=1.4 //Specific heat ratio(gamma)
cv=0.718 //Specific heat at constant volume in kJ/
    kgK
//Solution:
//(a)
T2=T1*(r)^(g-1),T3=round(Q/cv+T2) //Temperature at
    2, 3 in K
//(b)
eta=1-1/r^(g-1) //Thermal efficiency
//(c)
W=Q*eta //Workdone per cycle in kJ/kg
//Results:
printf("\n (a)The maximum temperature attained in
```

```
   the cycle, T3 = %d degreeC",T3-273)
printf("\n (b)The thermal efficiency of the cycle,
   eta = %.1f percent",eta*100)
printf("\n (c)The workdone during the cycle/kg of
   working fluid, W = %d kJ\n\n",W)
```

Scilab code Exa 2.5 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
r=8 //Compression ratio
P1=1,P3=50 //Pressure at 1, 3 in bar
T1=100+273 //Temperature at 1 in K
m=1 //Air flow in kg
R=0.287 //Specific gas constant in kJ/kgK
g=1.4 //Specific heat ratio(gamma)
//Solution:
//Refer fig 2.22
//Point 1
V1=m*R*10^3*T1/(P1*10^5) //Ideal gas equation,
   Volume at 1 in m^3
//Point 2
P2=P1*r^g //Pressure at 2 in bar
V2=V1/r //Volume at 2 in m^3
T2=P2*V2*T1/(P1*V1) //Temperature at 2 in K
//Point 3
V3=V2 //Constant volume process, Volume at 3 in m^3
T3=(P3/P2)*T2 //Temperature at 3 in K (Wrong in book
   )
//Point 4
P4=P3*(1/r)^g //Pressure at 4 in bar
V4=V1 //Constant volume process, Volume at 4 in m^3
T4=T1*(P4/P1) //Temperature at 4 in K
cv=R/(g-1) //Specific heat at constant volume in kJ/
```

```
kgK
ratio=(cv*(T3-T2))/(cv*(T4-T1)) //Ratio of heat supplied to the heat rejected (Round off error)
//Results:
printf("\n Point 1:\n Pressure = %d bar, Volume = %.4f m^3, Temperature = %d degreeC",P1,V1,T1-273)
printf("\n\n Point 2:\n Pressure = %.1f bar, Volume = %.4f m^3, Temperature = %.1f degreeC",P2,V2,T2-273)
printf("\n\n Point 3:\n Pressure = %.1f bar, Volume = %.4f m^3, Temperature = %.1f degreeC",P3,V3,T3-273)
printf("\n\n Point 4:\n Pressure = %.2f bar, Volume = %.4f m^3, Temperature = %.1f degreeC",P4,V4,T4-273)
printf("\n\n Ratio of heat supplied to the heat rejected = %.3f\n\n",ratio)
//Textbook answer for T3 is wrong
//Round off error in the value of 'ratio'
```

Scilab code Exa 2.6 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
P1=1 //Pressure at 1 in bar
T1=15+273 //Temperature at 1 in K
r=8 //Compression ratio
Q1=1000 //Heat added in kJ/kg
cv=0.718 //Specific heat at constant volume in kJ/kgK
g=1.4 //Specific heat ratio(gamma)
//Solution:
//Refer fig 2.23
//(a)
```

```
P2=P1*(r)^g //Pressure at 2 in bar
T2=T1*r^(g-1) //Temperature at 2 in K
T3=Q1/cv+T2 //Temperature at 3 in K (Round off error
    )
//(b)
eta=1-1/r^(g-1) //Air standard efficiency
//(c)
W=Q1*eta //Work done in kJ/kg (Round off error)
//(d)
Q2=Q1-W //Heat rejected in kJ/kg
//Results:
printf("\n (a)The maximum temperature in the cycle,
    T3 = %d degreeC",T3-273)
printf("\n (b)The air standard efficiency, eta = %.1
    f percent",eta*100)
printf("\n (c)The workdone per kg of air = %d kJ/kg"
    ,W)
printf("\n (d)The heat rejected = %d kJ/kg",Q2)
//Round off error in the values of 'T3' and 'W'
```

Scilab code Exa 2.7 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
P1=1.05,P2=13,P3=35 //Pressure at 1, 2, 3 in bar
T1=15+273 //Temperature at 1 in K
cv=0.718 //Specific heat at constant volume in kJ/
    kgK
R=0.287 //Specific gas constant in kJ/kgK
//Solution:
r="V1/V2" //Compression ratio
g=R/cv+1 //Specific heat ratio(gamma)
r=(P2/P1)^(1/g) //By adiabatic process relation
eta=1-1/r^(g-1) //Air standard efficiency
```

```
T2=P2*T1/(P1*r) //Temperature at 2 in K
T3=(P3/P2)*T2 //Temperature at 3 in K
Q1=cv*(T3-T2) //Heat added in kJ/kg
W=Q1*eta //Work done in kJ/kg
V1=1*R*10^3*T1/(P1*10^5) //Ideal gas equation, Volume at 1 in m^3/kg
V2=V1/r //Volume at 2 in m^3/kg
V_s=V1-V2 //Swept volume in m^3/kg
mep=W*1000/(V_s*10^5) //Mean effective pressire in bar
//Results:
printf("\n The air standard efficiency, eta = %.1f percent",eta*100)
printf("\n The compression ratio, r = %d",r)
printf("\n The mean effective pressure, mep = %.2f bar\n",mep)
```

Scilab code Exa 2.8 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
r=8 //Compression ratio
T1=20+273 //Temperature at 1 in K
P1=1 //Pressure at 1 in bar
Q1=1800 //Heat added in kJ/kg
cv=0.718 //Specific heat at constant volume in kJ/kgK
g=1.4 //Specific heat ratio(gamma)
//Solution:
T2=T1*r^(g-1) //Temperature at 2 in K
T3=Q1/cv+T2 //Temperature at 3 in K (printing error)
P2=P1*(r)^g //Pressure at 2 in bar
P3=P2*(T3/T2) //Pressure at 3 in bar
T4=T3/r^(g-1) //Temperature at 4 in K
```

```
eta=1-1/r^(g-1) //Air standard efficiency
W1_2=cv*(T1-T2) //Work done for process 1-2 in kJ/kg
W3_4=cv*(T3-T4) //Work done for process 3-4 in kJ/kg
W=W1_2+W3_4 //Net work done for the cycle in kJ/kg
V1=cv*(g-1)*10^3*T1/(P1*10^5) //Ideal gas equation, Volume at 1 in m^3/kg
V2=V1/r //Volume at 2 in m^3/kg
V_s=V1-V2 //Swept volume in m^3/kg
mep=W*1000/(V_s*10^5) //Mean effective pressire in bar
//Results:
printf("\n The maximum temperature, T3 = %d K",T3)
printf("\n The maximum pressure, P3 = %.1f bar",P3)
printf("\n The temperature at the end of the expansion process, T4 = %d K",T4)
printf("\n The air standard efficiency, eta = %.1f percent",eta*100)
printf("\n The mean effective pressure of the cycle, mep = %.1f bar\n\n",mep)
//Answers in the book are wrong
```

Scilab code Exa 2.9 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
power=50 //Internal power in kW
N=4800 //Engine speed in rpm
l=80,d=80 //Stroke and bore of engine in mm
n=4 //Number of cylinders
V_c=50000 //Clearance volume in mm^3
delta_P=45 //Pressure rise during combustion in bar
g=1.4 //Specific heat ratio(gamma)
//Solution:
//Refer fig 2.24
```

```
V_s=(%pi/4)*d^2*l //Swept volume in mm^3
r=(V_c+V_s)/V_c //Compression ratio
eta=1-1/r^(g-1) //Air standard efficiency
ideal_mep=eta*delta_P/((g-1)*(r-1)) //Ideal mean
    effective pressure in bar
W=power*60*2/(n*N) //Actual work transfer per cycle
    per cylinder in kJ
V_s=V_s*1D-9 //Swept volume in m^3
actual_mep=W*1000/(V_s*10^5) //Actual mean effective
    pressire in bar
//Results:
printf("\n The mean effective pressure of the engine
    , actual mep = %.2f bar",actual_mep)
printf("\n The mean effective pressure of the Otto
    cycle, ideal mep = %.2f bar\n\n",ideal_mep)
```

Scilab code Exa 2.10 Calculations on Otto cycle

```
//Calculations on Otto cycle
clc,clear
//Given:
CV=42000 //Calorific value of the fuel in kJ/kg
a=30/100,b=70/100 //Fraction of compression stroke
    at point a, b
P_a=1.33,P_b=2.66 //Pressure at point a, b
n=1.33 //Polytropic index
eta_cycle=50/100 //Air standard cycle efficiency
//Solution:
//Refer fig 2.25
//Since, compression follows PV^n = C
//Thus, P_a*V_a^n = P_b*V_b^n
//Assume a_b = V_a/V_b
a_b=(P_b/P_a)^(1/n) //Ratio of volume at a to volume
    at b
//Defining the function, ratio of r(compression
```

```
ratio)
function [ratio]=Volume(r)
    V_a=1+0.7*(r-1)
