Book Description

Title: Non-conventional Energy Sources

Author: G. D. Rai

Publisher: Khanna Publishers

Edition: 1

Year: 2010

ISBN: 8174090738

Scilab numbering policy used in this document and the relation to the above book.

Exa Example (Solved example)

Eqn Equation (Particular equation of the above book)

AP Appendix to Example(Scilab Code that is an Appednix to a particular Example of the above book)

For example, Exa 3.51 means solved example 3.51 of this book. Sec 2.3 means a scilab code whose theory is explained in Section 2.3 of the book.

Contents

List of Scilab Codes

Chapter 2

Solar radiation and its Measurement

Scilab code Exa 2.4.1 Local solar time and declination

```
//Ex2.4.1.;Detremine local solar time and declination

//The local solar time=IST-4(standard time longitude -longitude of location)+Equation of time correstion
//IST=12h 30min;for the purpose of calculation we are writing it as a=12h,b=29 min 60sec;
a=12;
b=29.60;
//(standard time longitude-longitude of location)=82 degree 30min - 77 degree 30min;
//for the purpose of calculation we are writing it as
STL3=82.5-72.5;
//Equation of time correstion: 1 min 01 sec
//for the purpose of calculation we are writing it as
c=1.01;
```

```
//The local solar time=IST−4(standard time longitude
   −longitude of location)+Equation of time
   correstion
LST=b-STL3-c;
printf(" The local solar time=%f.%f in hr.min.sec",a
   ,LST);
//Declination delta can be obtain by cooper's eqn :
   delta=23.45*sin((360/365)*(284+n))
n=170;//(on June 19)
//let
a=(360/365)*(284+n);aa=(a*%pi)/180;
//therefore
delta=23.45*sin(aa);
printf("\n delta=%f degree",delta);
```

Scilab code Exa 2.4.2 Angle made by beam radiation

```
//Ex2.4.2.;Calculate anglr made by beam radiation
   with the normal to a flat collector.
gama=0;//since collector is pointing due south.
//For this case we have equation : cos_(theta_t)=cos
   (fie−s)*cos(delta)*cos(w)+sin(fie−s)*sin(delta)
//with the help of cooper eqn on december 1,
n=335;
//let
a=(360/365)*(284+n);aa=(a*%pi)/180;
//therefore
delta=23.45*sin(aa);
printf(" delta=%f degree",delta);
//Hour angle w corresponding to 9.00 hour=45 Degreew
w=45;//degree
//let
a=cos(((28.58*%pi)/180)-((38.58*%pi)/180))*cos(delta
   *%pi*180^-1)*cos(w*%pi*180^-1);
b=sin(delta*%pi*180^-1)*sin(((28.58*%pi)/180)
```

```
    -((38.58*%pi)/180));
//therefore
cos_of_theta_t=a+b;
theta_t=acosd(cos_of_theta_t);
printf("\n theta_t=%f Degree",theta_t);
```

Scilab code Exa 2.7.1 Average value of Solar radiation on a horizontal surface

```
//Ex2.7.1.;Determine the average values of radiation
    on a horizontal surface

//Declination delta for June 22=23.5 degree, sunrice
    hour angle ws
delta=(23.5*%pi)/180;//unit=radians
fie=(10*%pi)/180;;//unit=radians
//Sunrice hour angle ws=acosd(-tan(fie)*tan(delta))
ws=acosd(-tan(fie)*tan(delta));
printf(" Sunrice hour angle ws=%f Degree",ws);
n=172;//=days of the year (for June 22)
//We have the relation for Average insolation at the
    top of the atmosphere
//Ho=(24/%pi)*Isc*[{1+0.033*(360*n/365)}*((cos (fie)
    *cos(delta)*sin(ws))+(2*%pi*ws/360)*sin(fie)*sin(
    delta))]
Isc=1353;//SI unit=W/m^2
ISC=1165;//MKS unit=kcal/hr m^2
//let
a=24/%pi;
aa=(360*172)/365;aaa=(aa*%pi)/180;
b=cos(aaa);bb=0.033*b;bbb=1+bb;
c=(10*%pi)/180;c1=cos(c);
cc=(23.5*%pi)/180;cc1=cos(cc);
ccc=(94.39*%pi)/180;ccc1=sin(ccc);
c=c1*cc1*ccc1;
```

```
d=(2*%pi*ws)/360;
e=(10*%pi)/180;e1=sin(e);
ee=(23.5*%pi)/180;ee1=sin(ee);
e=e1*ee1;
//therefoe Ho in SI unit
Ho=a*Isc*(bbb*(c+(d*e)));
printf("\n SI UNIT->Ho=%f W/m^2",Ho);
Hac=Ho*(0.3+(0.51*0.55))
printf("\n SI UNIT->Hac=%f W/m^2 day",Hac);
ho=a*ISC*(bbb*(c+(d*e)));
printf("\n MKS UNIT->Ho=%f kcal/m^2",ho);
hac=ho*0.58;
printf("\n MKS UNIT->Hac=%f kcal/m^2 day",hac);

//The values are approximately same as in textbook
```

Chapter 3

Solar Energy Collectors

Scilab code Exa 3.6.1 Solar altitude angle and Incident angle and Collector efficiency

```
//Ex3.6.1.;calculate: solar altitude anglr,Incident
   angle,Collector efficiency

//Solar declination :delta
n=1
delta=23.45*sin((360/365)*(284+n));
printf(" Solar declination delta=%f degree",delta);
fie=22;//degree
//solar hour angle ws=0,(at mean of 11:30 and 12:30)
ws=0;
//Solar altitude anglr alpha is given by

//alpha=asind(((cos(fie)*cos(delta)*cos(ws))+(sin(
   fie)*sin(delta)))
//let
a=cos((22*%pi)/180)*cos((-23*%pi)/180)*cos(0);
b=sin((22*%pi)/180)*sin((-23*%pi)/180);
//therefore
sin_alpha=a+b;
printf("\n sin_aplha=%f",sin_alpha);
```

```
alpha=asind(sin_alpha);
printf("\n aplha=%f Degree",alpha);
//Incident angle
theta=(180/2)-alpha;
printf("\n Incident angle=%f Degree",theta);
//Rb is given by
Rb=((cos(((22*%pi)/180)-(37*%pi)/180)*cos((-23*%pi)/180)*cos(0))+(sin(((22*%pi)/180)-(37*%pi)/180)*sin((-23*%pi)/180)))/sin_alpha;
printf("\n Rb=%f",Rb);
//Effective absorptance product is <t.alpha>=t.alpha / 1-(1-alpha)*pd
pd=0.24;//Diffuse reflectance for two glass covers
//let TA=<t.alpha>
TA=(0.88*0.90)/(1-(1-0.90)*pd);
printf("\n Effective absorptance product is <t.alpha>=%f",TA);
//Solar radiation intensity(consider beam radiation only)
//Hb=0.5 ly/mm = 0.5 cal/cm^2 * min
Hb=((0.5*10^4)/10^3)*60;//unit=kcal/m^2 hr
printf("\n Hb=%f kcal/m^2 hr",Hb);
Hb=Hb*1.163;//unit=W/m^2 hr;   [since  1 kcal = 1.163 watt]
printf("\n Hb=%f W/m^2 hr",Hb);
//S=Hb*Rb*<t.alpha>

printf("\n S=%f W/m^2 hr",S);
s=S/1.163;
printf("\n S=%f kcal/m^2 hr",s);
//Useful gain
//qu=FR(S-UL*(Tfi-Ta))
qu=0.810*(s-(6.80*(60-15)))
printf("\n qu=%f kcal/m^2 hr",qu);
//Qu=FR(S-UL*(Tfi-Ta))
Qu=0.810*(S-(7.88*(60-15)))
printf("\n qu=%f W/m^2 hr",Qu);
//Collection Efficiency  : nc=(qu/(Hb*Rb))*100;
```

```
nc=(28.07/(300*Rb))*100;
printf("\n Collection Efficiency=%f persent",nc);

//values of "sine alpha" in the textbook is taken approximate to the real values
```

Scilab code Exa 3.9.1 Useful gain and exit fluid temperature and collection efficiency

```
//calculate the useful gain,exit fluid temperature and collection efficiency
//Optical properties are estimated as
p=0.85;
//(T. alpha)=0.77;let A=(T. alpha)
A=0.77
gama=0.94;
Do=0.06;
L=8;//unit=meter,//L=length of concentrator
W=2;//W=width of concentrator in meter
dco=0.09;//dco=diameter of transpaarent cover
Ar= %pi*Do*L;//Ar=area of the receiver pipe
A_alpha=(W-dco)*L;//aperture area of the concentration
Cp=0.30;//unit=kcal/kg degree calcius
m=400;//unit=kg/hr,m=flow rate
HbRb=600;//unit=kcal/hr m^2
Tfi=150;//degree calcius
T_alpha=25;//degree calcius
//Heat transfer coefficient from fluid inside to surroundings,
Uo=5.2;//unit=kcal/hr-m^2
//Heat transfer coefficient from absorber cover surface to surroundings,
UL=6;//unit=kcal/hr-m^2
```

```
F=(Uo/UL);
//Heat removed factor FR is
//FR=((m*Cp)/(Ar*UL))*(1-(%e^-((Ar*UL*F)/(m*Cp))))
//let X=(m*Cp)/(Ar*UL);Y=(%e^-((Ar*UL*F)/(m*Cp)))
X=(m*Cp)/(1.51*UL*0.86);
Y=%e^(-1/X);
FR=X*0.86*(1-Y);
//Absorbed solar energy is
S=HbRb*p*gama*A;
printf(" Area of the receiver pipe Ar= %f=1.51 m^2 \n A_aplha= %f m^2=collection efficiency factor ",Ar,A_alpha);
printf("\n value of F= %f",F);
printf("\n Heat removed factor FR=%f \n Absorbed solar energy is \n S=%f kcal/Hr m^2 .....(MKS) ",FR,S);
//for unit in S.I.   , 1 kcal/Hr m^2 = 1.16298 W/m^2
s= S*1.16298; //in W/m^2
printf("\n S=%f W/m^2.....(SI)",s);
//the values of F,FR will be same in any unit,since they are factors(dimensionless)
//Useful Gain=Qu=A_alpha*FR*(S-((Ar*UL)/A_alpha)*(Tfi-T_alpha))
//In MKS unit
Qu=A_alpha*FR*(S-((1.51*UL)/A_alpha)*(Tfi-T_alpha))
printf("\n useful gain in (MKS) Qu=%f kcal/hr",Qu);
//IN SI unit
qu=A_alpha*FR*(s-((1.51*6.98)/A_alpha)*(Tfi-T_alpha))//UL=6.98 W/m^2 degree celcius
printf("\n useful gain in (SI) Qu=%f Watt",qu);
//the exit fluid temperature can be obtained from
tci=150;//degree celcius
tco=tci+(Qu/(m*Cp));//from Qu=mCp(tco-tc);  where, tco=collector fluid temp. at outlet,tci=Fluid inlet temp.
n=(Qu/(16*HbRb))*100;//ncollector=Qu/(A_alpha*HbRb)*100;
printf("\n collector fluid temp. at outlet  tco=%f
```

```
    degree celcius \n ncollector = %f percent ",tco,n
    );

//The values/results/answers is approximate in the
    text book to the real calculated value
```

Chapter 6

Wind Energy

Scilab code Exa 6.2.1 Torque and axial thrust

```
//Ex.6.2.1.
//For air,the value of gas constant
R=0.287 //unit=kj/kg K
//T=15 in degreecalcius
T=15+273;//in kalvin
RT=0.287*10^3*288;
P=1.01325*10^5;//unit=Pa;at 1 atm
Vi=15;//unit=m/s
gc=1;
D=120;//turbine diameter;unit=m
N=40/60;
//Air density
p=(P/RT);
printf("Air density p=%f kg/M^3",p);
//1] Total_power= Ptotal=p*A*Vi^3/2*gc
//power density =Ptotal/A=p*Vi^3/2*gc
power_density=(1/(2*gc))*(p*Vi^3);

printf("\n maximum axial thurst=%f Newton",Fxmax);
```

Chapter 7

Energy from Biomass

Scilab code Exa 7.15.1 Volume of biogas digester and power available from the digester

```
//Ex7.15.1; calculate volume of biogas digester and power available from the digester
//Mass of the dry input
M0=2*5;//M0=2.5 kg/day * 5
pm=50;//unit=kg/m^3
tr=20;//retention time in days
C=0.24;//unit=m^3 per kg;Biogas yeild.
n=0.6;//efficiency of burner
Hm=28;//unit=MJ/m^3//combustion of methane
Fm=0.8;//methane proportional
//Fluid volume Vf is =M0/pm
Vf=M0/pm;
printf(" Mass of the dry input M0=%f kg/day \n Fluid volume Vf=%f m^3 /day",M0,Vf);
//for expression Vd=Vftr,the digester volume is
Vd=Vf*tr;
printf("\n Vd=%f m^3",Vd);
//volume of biogas is Vb=C*M0= biogas yield input * mass of dry input
Vb=C*M0;
```

```
printf("\n volume of biogas is Vb=%f m^3 /day",Vb);
//The Power available from the digester is
E=n*Hm*Fm*Vb;
printf("\n The Power available from the digester=%f Mj/day",E);
E=E*0.2728;//unit=kWh/day
printf("=%f kWh/day",E);
E=E*41.8//unit=W(continuous thermal)
printf("=%f W(continuous thermal)",E);
```

Chapter 8

Geothermal Energy

Scilab code Exa 8.5.1 Plant efficiency and Heat rate

```
//Ex8.5.1.;calculate: steam flow rate,cooling water
    flow,plant efficiency,Heat rate

//Enthalpy at point 1 at (31 kg/cm^2)=669.6 kcal/kg
//H1=H2=H3,enthalpy remain constant during
    throttling
H1=669.7;//unit= kcal/kg
H2=669.7;//unit= kcal/kg
H3=669.7;//unit= kcal/kg
//At point 3,
P3=9.55;//unit= kg/cm^2
//specific volume
vs3=0.22;//unit=m^3/kg
//Entropy
S3=1.580
T3=190;//unit=degree C,(degree of superheat=13
    degree C)
//S4_s at 0.34 kg/cm^2=S3
//x4_s=0.838
//and H4_s=hs+xL
H4_s=72+(0.838*556)
```

```
printf(" H4_s=%f kcal/kg",H4_s)
//Isentropic turbine work=H3-H4_s
ITW=H3-H4_s;
printf("\n Isentropic turbine work=%f kcal/kg",ITW);
//Actual turbine work
ATW=0.80*ITW;
printf("\n Actual turbine work=%f kcal/kg",ATW);
H4=669.7-ATW;
printf("\n H4=%f kcal/kg",H4)
h5_6=72;//unit= kcal/kg; (Ignoring pump work)
//sensible heat   h7=h5=25 kcal/kg
h5=25;//unit=kcal/kg
h7=25;//unit=kcal/kg
//Turbine steam flow
TSF=(250*0.860*10^6)/(ATW*0.9);
printf("\n Turbine steam flow=%f kg/hr",TSF);
//let
m4=TSF;
//Turbine volume flow
TVF=(TSF/60)*vs3;
printf("\n Turbine volume flow=%f m^3/min",TVF);
//cooling water flow m7:m7(h5_6-h7)=m4(H4-h5_6)

vsup=0.27;
x3s=0.832;
H3s=535;//unit=kcal/kg
//Isentropic turbine work
ITW=H2-H3s;
printf(" Isentropic turbine work=%f kcal/kg",ITW);
//Actual turbine work
ATW=0.65*ITW;
printf("\n Actual turbine work=%f kcal/kg",ATW);
H3=669.6-ATW;
printf("\n H3=%f kcal/kg",H3)
//h_4-5(ignore bpump work)
h4=72.4;//unit=kcal/kg
//h6 at 27 degree c
h6=27;//unit=kcal/kg
```

```
//Turbine steam flow or hot water flow=power output/
   actual turbine work
TSF=(10*10^6*0.86)/ATW;
printf("\n Turbine steam flow or hot water flow=%f
   kg/hr",TSF);
//consider cooling water flow  m4:m3*(H3-h4)=m4(h4-
   h6)
//or
m4=((582.11-72.4)*0.983*10^5)/(72.4-27);
printf("\n cooling water flow=%f kg/hr",m4);
Heat_added=H1-h4
printf("\n Heat_added=%f kcal/kg",Heat_added);
//plant efficiency=Turbine work/Heat added
Plant_efficiency=(ATW/Heat_added);
plant_efficiency=Plant_efficiency*100;
printf("\n Plant Efficiency=%f persent",
   plant_efficiency);
//Plant heat rate=860/Plant Efficiency
Plant_heat_rate=860/Plant_efficiency;
printf("\n Plant heat rate=%f kcal/kWh",
   Plant_heat_rate);

//The value of m3=14.03*10^5 is given wrong in the
   text book;the actual value is m3=11.03*10^5
```

Chapter 9

Energy from the Oceans

Scilab code Exa 9.3.5.1 Energy Generated

```
//Ex9.3.5.1.;Calculate Energy generated
R=12;//unit=m; R is the range
r=3;//unit=m; the head below turbine stops operating
time=(44700/2);
A=30*10^6;
g=9.80;
p=1025;
//The total theoretical work W=integrate('1','w',R,r);
W=(g*p*A*((R^2)-(r^2)))/2;
printf(" W=%f ",W);
//The average power generated
Pav=W/time;//unit=watts
printf("\n The average power generated=%f watts",Pav);
pav=(Pav/1000)*3600;//unit=kWh
printf("\n The average power generated=%f kWh",pav)
//the energy generated
Energy_generated=pav*0.73
printf("\n Energy generated=%f kWh",Energy_generated);
```

Scilab code Exa 9.3.6.1 The Yearly Power Output

```
//Ex9.3.6.1;calculate power in h.p. at any instant and the yearly power output
A=0.5*10^6;//unit=m
h0=8.5;//unit=m
t=3*3600//unit=s; since t=3 hr
p=1025;//unit=kg/m^3
h=8;//unit=m
n0=0.70;//efficiency of the generator;70%
//volume of the basin=Ah0
volume_of_the_basin=A*h0;
//Average discharge Q=volume/time period
Q=(A*h0)/t;
printf(" volume of the basin=%f m^3 \n Average discharge Q=%f m^3 /s",volume_of_the_basin,Q);
//power at any instant
P=((Q*p*h)/75)*n0;
printf("\n power at any instant P=%f h.p.",P);
//The total energy in kWh/tidal cycle
E=P*0.736*3;
printf("\n The total energy in kWh/tidal cycle E=%f",E);
//Total number of tidal cycle in a year=705
printf("\n Total number of tidal cycle in a year=705");
//Therefore Total output per annum
Total_output_per_annum=E*705;
printf("\n Total output per annum=%f kWh/year",Total_output_per_annum);

//The value of "power of instant" in a text book is misprinted.
```

Chapter 10

Chemical Energy Sources

Scilab code Exa 10.2.8.1 Reversible Voltage for Hydrogen oxygen fuel cell

```
//Ex10.2.8.1;Find Reversible voltage for hydrogen
    oxygen fuel cell
del_G=-237.3*10^3;//Joules/gm-mole of H2
//Reversible voltafe E of a cell is given by =
    del_Wrev/nF=-del_G/nF
//since 2 electrons are transferred per molecule of
    H2.thus
n=2;
F=96500;//Faraday's constant
E=-del_G/(n*F);
printf("Reversible voltage=%f volts",E);
```

Scilab code Exa 10.2.8.2 Voltage output and efficiency and heat transfer

```
//Ex10.2.8.2;calculate voltage output of cell,
    efficiency,electric work output,heat transfer to
    the surroundings

```

```
//1] voltage output of cell
del_G=-237.3*10^3;//Joules/gm-mole of H2
n=2;
F=96500;//Faraday's constant
E=-del_G/(n*F);
printf(" E=%f volts",E);
//2] Efficiency
//nmax=del_Wmax/-(del_H)25 degree celcuis = -(del_G)T/(-del_H)25
del_G_at298k=-56690;//unit=kcal/kg mole
del_H_at298k=-68317;//unit=kcal/kg mole
nmax=del_G_at298k/del_H_at298k,
printf("\n nmax=%f",nmax);
//3]Electric work output per mole
F=(96500/4.184);
del_Wrever=(n*F*E);
printf("\n Electric work output per mole=%f kcal/kg mole",del_Wrever);
//4] Heat transfer to the surroundings
//the heat transfer is Q=T*del-s=del_H_at298k-del_G_at298k
Q=del_H_at298k-del_G_at298k;
printf("\n The heat transfer is Q=%f kcal/kg mole",Q);
//The negative sign indicates that the heat is removed from the cell and transferred to the surrounding

//value of "Electric work output per mole" is approximate in the text book to the real calculated value
```

Scilab code Exa 10.2.8.3 Voltage output and efficiency and heat transferred

```
//Ex10.2.8.3;The heat transferred to the surrounding
del_G_at298k=-237191;//unit=kJ/kg mole
del_H_at298k=-285838;//unit=kJ/kg mole
ne=2;
F=96500;//Faraday's constant
E=-del_G_at298k/(ne*F);
printf(" E=%f volts",E);
nmax=del_G_at298k/del_H_at298k,
printf("\n nmax=%f",nmax);
nmax=nmax*100;
printf("=%f persent",nmax);
//Electric work output per mole of the fule is We=-del_G kJ/kg mole
We=del_G_at298k;//kJ/kg mole
